

---

## 3C05: Risk Management

## Unit 3: Risk Management

---

### Objectives

- To explain the concept of *risk* & to develop its role within the software development process
- To introduce the use of risk management as a means of identifying & controlling risk in software development

## What is risk?

---

It is **not** just a game!

© Wolfgang Emmerich & Anthony Finkelstein

3

## Definitions of risk

---

- "The possibility of suffering harm or loss; danger"
- "The possibility of loss or injury"
- "Chance of danger, injury, loss"
- "A measure of the probability & severity of adverse effects"

Probability/  
uncertainty

Something bad  
happening

© Wolfgang Emmerich & Anthony Finkelstein

4

## Risks in the everyday world

---

- **Financial risks** - "your house is at risk if you fail to repay your mortgage or any loans secured on it"
- **Health risks** - "the chance that a person will encounter a specified adverse health outcome (like die or become disabled)"
- **Environmental & ecological risks** - "the likelihood of extinction due to exposure of terrestrial wildlife to contaminants"
- **Security risks** - "there is a significant risk that widespread insertion of government-access key recovery systems into the information infrastructure will exacerbate, not alleviate, the potential for crime and information terrorism"

More examples?

© Wolfgang Emmerich & Anthony Finkelstein

5

## How is risk dealt with?

---

- **Basic process:** identify the risk -> analyse its implications -> determine treatment methods -> monitor performance of treatment methods
- Techniques & heuristics for the identification, analysis, treatment & monitoring of risk

Insurance companies depend on understanding risk

- Risk management is a project management tool to assess & mitigate events that might adversely impact a project, thereby increasing the likelihood of success

© Wolfgang Emmerich & Anthony Finkelstein

6

## Why is the software world interested in risk?

- Many post-mortems of software project disasters indicate that problems would have been avoided (or strongly reduced) if there had been an explicit early concern with identifying & resolving high-risk elements!
- An obvious cost factor!

Browse the forum on "Risks To The Public In Computers & Related Systems"  
<http://catless.ncl.ac.uk/Risks>

Successful project managers are good risk managers!

## Sources of software risk (systems context)

Reproduced from [Higuera 1996]  
"Software Risk Management", Technical Report  
CMU/SEI-96-TR-012, ESC-TR-96-012, June 1996

## Why is it often forgotten?

---

- Optimistic enthusiasm at the start of projects
- Software process can lead to over-commitment & binding requirements much too early on
- Premature coding
- The “add-on” syndrome
- Warning signals are missed
- Legal implications
- Poor software risk management by project managers

© Wolfgang Emmerich & Anthony Finkelstein

9

## Software risk management

---

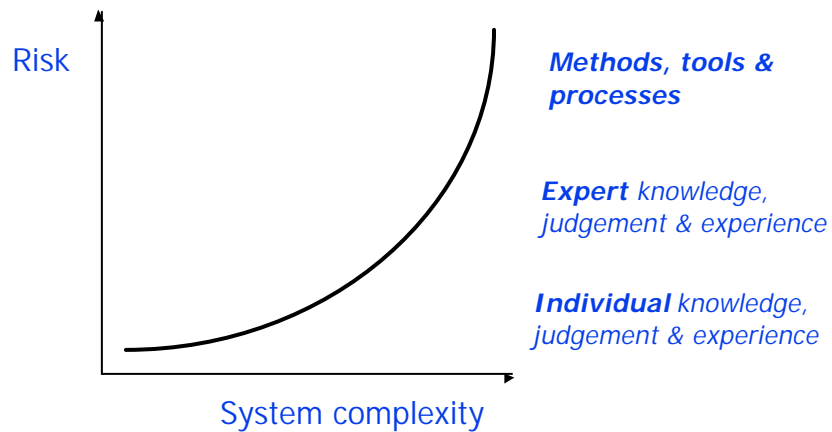

- Objectives
  - To identify, address & eliminate risk items before they become either threats to successful software operation or major sources of software rework
  - Necessary that some form of measurement is undertaken to determine & classify the range of risks a software development project faces, & to identify areas where a *significant* exposure exists
- The discipline attempts to provide a set of principles & practices to achieve the above
- A response to *change & uncertainty*

© Wolfgang Emmerich & Anthony Finkelstein

10

## The need to manage risk

---

Reproduced from [Higuera 1996]

© Wolfgang Emmerich & Anthony Finkelstein

11

## The questions

---

What can go wrong?

What is the likelihood it will go wrong?

What are the consequences?

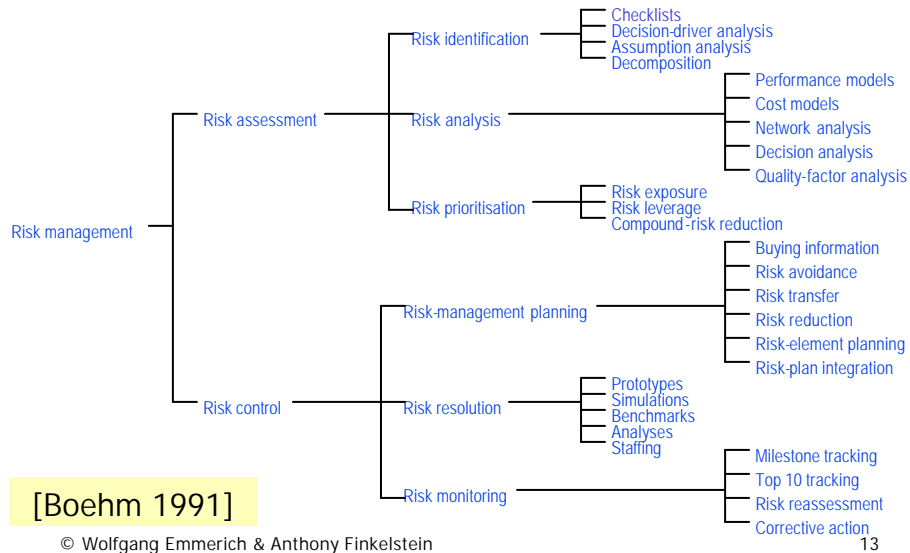

What can be done?

What options are available?

© Wolfgang Emmerich & Anthony Finkelstein

12

## Software risk management steps & techniques

13

## Risk assessment

- **Risk identification** - listing project-specific risk items that are likely to compromise a project's success

- **Risk analysis** - assessing the loss probability & loss magnitude for each identified risk item, & assessing compound risks

- **Risk prioritisation** - ordering & ranking the risk items identified & analysed

## Risk control

---

- **Risk-management planning** - doing the ground work so as to be in a position to address each risk item

- **Risk resolution** - producing a situation in which risk items are eliminated or resolved

- **Risk monitoring** - tracking the project's progress towards resolving risk items & taking corrective action where required

## E.g. top 10 risks in software project mgmt

---

1. Personnel shortfalls
2. Unrealistic schedules & budgets
3. Developing the wrong functions & properties
4. Developing the wrong user interface
5. Gold-plating
6. Continuing stream of requirements changes
7. Shortfalls in externally furnished components
8. Shortfalls in externally performed tasks
9. Real-time performance shortfalls
10. Straining computer-science capabilities

[Boehm 1991]

Determine a risk-management technique to deal with each of these

## E.g. project sizing matrix

Event	Description					Consequence			Risk
	1	2	3	4	5	1	2	3	
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power
Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power	Loss of power

Always a question of balance - full risk analysis may not improve risk probability estimation significantly!

[Used @ DERA]

© Wolfgang Emmerich & Anthony Finkelstein

## E.g. prioritisation scheme

- Risk-exposure quantity is an effective technique for risk prioritisation
  - Assess risk probabilities & losses on a scale 0-10
  - Multiply probability by loss to determine exposure

Unsatisfactory outcome	Probability of unsatisfactory outcome	Loss caused by unsatisfactory outcome	Risk exposure
Software error loses key data	3-5	8	24-40
Processor memory insufficient	1	7	7

- Relies on accurate estimates of the probability & loss associated with an unsatisfactory outcome

© Wolfgang Emmerich & Anthony Finkelstein

## E.g. risk management plan

- The Risk Management Plan (RMP) presents the process for implementing *proactive* risk management as part of overall project management
- The RMP describes techniques for identifying, analysing, prioritising & tracking risks; developing risk-handling methods; & planning for adequate resources to handle each risk, should they occur
- The RMP also assigns specific risk management responsibilities & describes the documenting, monitoring & reporting processes to be followed

© Wolfgang Emmerich & Anthony Finkelstein

19

## E.g. PMP summarised as a risk register

Risk Register Risk Questionnaire/Assessment Summary Risk Questionnaire/Assessment Summary

Project: .....

Classification: .....

Reference: .....

Serial No.	Risk Type (see note 2)	Risk Title	Probability of occurrence	Impact on:			Risk reduction measures	Fallback position/ contingency	Owner of risk
				Time	Cost	Perform			
1									
2									
3									
4									
5									
6									

Note: 1. Questionnaire may be created to meet individual project requirements. However, a standard questionnaire covering the minimum issues to be addressed will probably take this form. The risk questionnaire may become the risk register.

2. Risk Types: Technical  
Project Management  
Commercial  
External

[Used @ DERA]

© Wolfgang Emmerich & Anthony Finkelstein

20

## Ways of dealing with risks

---

- **Elimination:** where exposure to risk is terminated
- **Retention:** where the risk is made tolerable, perhaps after some modification
- **Avoidance:** where the risk is negated in some way, possibly by redesign of work methods
- **Transfer:** where the risk is passed to a third party, either contractually or via insurance
- Need to balance *acceptable* risks

© Wolfgang Emmerich & Anthony Finkelstein

21

## Implement & ..... track

---

- An on-going process of measuring the effect that implementation of a risk management programme has had & its ability to continue
- Focus on the high-risk, high-leverage critical success factors
  - Rank a project's most significant risk items (prepare)
  - Establish a regular schedule for review of progress (meet)
  - Summarise progress on top risk items (discuss)
  - Focus on handling any problems in resolving the risk items (act)

© Wolfgang Emmerich & Anthony Finkelstein

22

## Putting risk management into practice

---

- Insert risk management principles & practices into your software development process, so they are risk-oriented & risk-driven - do this gradually & incrementally
- Start with a top 10 risk-item tracking process - lightweight, cheap & good returns!
- Develop a WWWWWHHM RMP template to populate
- Not a prescription - relies on *good* human judgement!

A focus on CSFs can help you win work!

## The BIGGEST risk?

---

Not knowing  
what the  
risks are!

## Key points

---

- The enemy of the software manager is risk
- Software projects must manage risks to minimise their consequences
- Time spent identifying, analysing & managing risk pays off!
- You can use the 6 stage conceptual framework with its associated techniques as a solid starting point
- If nothing else, be risk aware...
