GI 2019

GI 2019, Montreal, ICSE-2019 workshop
Maintaining Embedded Constants

- **EuroGP 2018**
  - RNAfold 7000 lines of code 50000 numbers
  - On average better predictions of RNA folding.
  - Shipped since 2.4.7

- **SSBSE-2018** sqrt converted to cube root
  - New functionality, double precision accuracy

- **RN/18/05** generate $\log_2$ from existing open source maths framework

W. B. Langdon, UCL
RNAfold reads RNA molecules base sequence. Outputs prediction of how molecule will fold up. Internally RNAfold uses 51521 parameters.
Fitness of Mutated RNAfold

- Mutate constants inside RNAfold and recompile
- Run mutated RNAfold on training RNA sequences
- Compare each new prediction with real structure
- Fitness mean Matthew’s correlation coefficient on 681 training RNA molecules

681 short training sequences

681 new predictions
Genetic Improvement of RNAfold

RNAfold state of the art prediction of how RNA molecule will fold up based on its sequence of bases.

- Speed up via Intel SSE parallel instructions [GI 2017](#). Shipped since V2.3.5
- ViennaRNA Package [v2.3.0cuda](#)
- Better predictions by evolving parameters
  - On average better predictions of RNA folding.
  - Shipped since 2.4.7
- AVX speedup will be in release 2.4.11
Use evolution to convert table based sqrt into $\log_2$

By updating table of 512 floats (+small code change)

IEEE 754 Double Precision
GNU C library sqrt converted to log2

- Chosen implementation of sqrt divides normalised input into 512 bins.
- bin holds start point for Newton-Raphson
- 1 run evolutionary strategy per table value
  - Seed CMA-ES with square root values
    - Run code with CMA-ES generated table value
    - Fitness = absolute diff $\text{GI}_\log_2(x)$, $\log_2(x)$
      
    $x$ takes three test values: smallest, mid, max in bin
  - all 512 CMA-ES runs succeed

Newton-Raphson is iterative way to find roots of continuous function using its derivative
CMA-ES seeded with sqrt values

CMA-ES evolutionary run started with
- value from sqrt
- mutation step size from variability of sqrt table

CMA-ES very easy to solve

Initial seed values are close to log₂ values
Evolved values for Newton-Raphson

Evolved value scattered about theory
Evolved log$_2$

New table driven function tested many thousands of times:

– Same precision as GNU C sqrt():
– Almost always exact
– Worst case last bit double precision 2.2 $10^{-16}$
Automatic Software Maintenance

• In a world addicted to software, maintenance is the dominant cost of computing.

• Need to keep parameters up to date. Eg:
  – New science (cf. RNAfold), new laws or regulations, new users, new user expectations
  – Change of load, new hardware (eg bigger RAM), automatic porting
  – Search can be fast: \(\text{cbrt} < 5\) minutes, \(\log_2\) 6secs

• Little SBSE research

• Great scope for automation
Six impossible things before breakfast

- To have impact do something considered impossible.
- If you believe software is fragile you will not only be wrong but shut out the possibility of mutating it into something better.
- Genetic Improvement has repeatedly shown mutation need not be disastrous and can lead to great things.

W. B. Langdon, UCL
Summary

• Problem of maintaining data in code ignored
• SBSE to optimize data
  • suitable training data
  • treat code as a black box.
• RNAfold on real data
  – 50000 parameters 20% overall better prediction
  – AVX 45% speedup
• Rapidly generated new maths (cbrt, log₂)
• Need research on Automatic Data Tuning
• Software is not fragile
GI 2019, Montreal, ICSE-2019 workshop.
Submission (2 or 8 pages) due 1st February 2019

Humies: Human-Competitive
Cash prizes
GECCO-2019
Improving RNAfold parameters

- RNAfold 7100 lines of C source code, 51521 parameters.
- Fitness correlation between prediction and true structure (MCC).
- Post evolution tidy
- 14732 (29%) parameters changed
- Holdout set significant increase in MCC
- Also better than constrained optimisation
- GI parameters `rna_langdon2018.par` shipped with ViennaRNA since 13 Jun 2018
Cube Root Code Changes I

- Most implementations of square root use hardware support.
- GNU C library glibc 2.27 also includes Newton-Raphson iterative solution.
- Trap bad values, e.g. negative.
- Normalise double input to 0.5 .. 2.0.
- Guaranteed convergence in three steps:
  - Update both estimate of $\sqrt{x}$ and derivative.
- Apply square root to exponent, i.e. divide by 2.
Cube Root Code Changes II

- Remove trap for negative values
- Normalise double precision input to 1.0..2

  - Update both estimate of cube root $x^{\frac{1}{3}}$ and its derivative $\frac{1}{3}x^{-\frac{2}{3}}$

- Apply cube root to exponent, ie divide by 3

---

W. B. Langdon, UCL
Evolved log$_2$

New table driven function tested many thousands of times:

– Almost always exact (double precision).
– GI log2 always (except on NaN) returned a double y such that GNU C library exp2(y) is exactly x
  ▪ or y differs only in least significant bit from the closest value which could be inverted by exp2 to yield x.
– Worst case last bit double precision 2.2 $10^{-16}$
– Same precision as GNU C sqrt()
Square root to binary log

Frame work as sqrt to cbrt but

- Derivative known
- CMA-ES one dimension at a time (512 times)

very easy
