

## 3C05:Software Process Improvement

© Wolfgang Emmerich & Anthony Finkelstein

1

## Unit 8: Software Process Improvement

### Objectives

- To provide a framework for software process assessment and improvement
- To introduce the Capability Maturity Model (CMM) of the Software Engineering Institute

© Wolfgang Emmerich & Anthony Finkelstein

2

## Background

- A framework to help the US DoD pick software vendors more cleverly and hence obtain a quick and relatively inexpensive "productivity boost".
- Work at the CMU Software Engineering Institute, 1986 onwards.

Humphrey, W.S. (1988); Characterizing the Software Process: a maturity framework; IEEE Software; 5, 2, pp 73-79.

Humphrey W.S.; Kitson D.H. & Kasse T.C. (1989); The State of Software Engineering Practice: a preliminary report; Proc. IEEE 11th International Conference on Software Engineering; pp 277-288, IEEE CS Press.

## 5 Level Process Maturity Framework

continued improvement and optimisation of process

optimising

comprehensive process measurements, beyond those of cost & schedule performance

managed

defined development process to ensure consistent implementation

defined

rigorous project management of costs, schedule & changes

repeatable

initial

© Wolfgang Emmerich & Anthony Finkelstein

4

## Approach

- An effective software process is predictable, cost estimates and schedule commitments are met with reasonable consistency. The resulting products generally meet user needs.
- The key requirements for this to be achieved are:
  - measurement
  - statistical control

© Wolfgang Emmerich & Anthony Finkelstein

5

## Development Process Improvement

### FIVE STEPS

- (1) understand the current status of their development process or processes;
- (2) develop a vision of the desired process;
- (3) establish a list of required process improvement actions in order of priority;
- (4) produce a plan to accomplish these actions;
- (5) commit the resources to execute the plan.

© Wolfgang Emmerich & Anthony Finkelstein

6

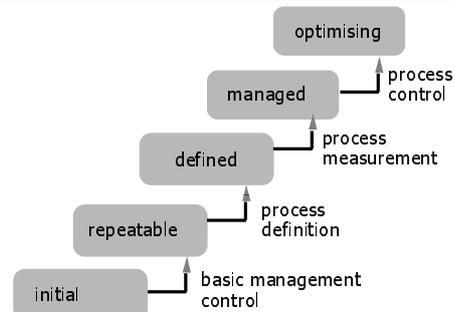

## Levels

- Levels are chosen because:
  - reasonably represent historical phases of evolutionary improvement of real software development organisations;
  - represent a measure of improvement that it is reasonable to achieve from the prior level;
  - suggest interim improvement goals and progress measures;
  - makes obvious a set of immediate improvement priorities.

© Wolfgang Emmerich & Anthony Finkelstein

7

## How to Move Between Levels

© Wolfgang Emmerich & Anthony Finkelstein

8

## Initial to Repeatable

- To get from initial to repeatable, you need:
  - project management;
  - management oversight;
  - quality assurance;
  - change control.
- You need *"commitment control"*.

© Wolfgang Emmerich & Anthony Finkelstein

9

## Repeatable to Defined

- To get from repeatable to defined, you need:
  - to establish a "process group";
  - a software development process architecture;
  - to introduce a family of software engineering methods and technologies.

© Wolfgang Emmerich & Anthony Finkelstein

10

## Defined to Managed

- To get from defined to managed, you need:
  - to establish a minimum, basic set of process measurements;
  - to establish a process database with the resources to manage and maintain it;
  - to provide sufficient process resources to gather and maintain this data;
  - assess the relative quality of each product and inform management where quality targets are not being met.

© Wolfgang Emmerich & Anthony Finkelstein

11

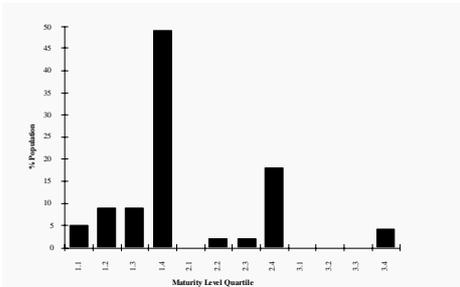

## Managed to Optimising

- To get from managed to optimising, you need:
  - to support automatic gathering of process data;
  - to use this data to both analyse and modify the process to prevent problems and improve efficiency.

12

## Results of SEI Assisted Assessment

© Wolfgang Emmerich & Anthony Finkelstein

13

## Key Questions for Level 2

- Does the Software Quality Assurance (SQA) function have a management reporting channel separate from the software development project management?
- Is there a software configuration control function for each project that involves software development?
- Is a formal procedure used in the management review of each software development prior to making contractual commitments?
- Is a formal procedure used to make estimates of software size?

© Wolfgang Emmerich & Anthony Finkelstein

14

## Key Questions for Level 2

- Is a formal procedure used to produce software development schedules?
- Are formal procedures applied to estimating software development cost?
- Are profiles of software size maintained for each software configuration item, over time?
- Are statistics on software code and test errors gathered?
- Does senior management have a mechanism for the regular review of the status of software development projects?

© Wolfgang Emmerich & Anthony Finkelstein

15

## Key Questions for Level 3

- Is there a software engineering process group function?
- Is there a required software engineering training programme for software developers?
- Is a formal training programme required for design and code review leaders?
- Does the software development organisation use a standardised software development process?

© Wolfgang Emmerich & Anthony Finkelstein

16

## Key Questions for Level 3

- Does the software development organisation use a standardised and documented software development process on each project?
- Are statistics on software design errors gathered?
- Are internal software design reviews conducted?
- Is a mechanism used for controlling changes to the software design?
- Are software code reviews conducted?

© Wolfgang Emmerich & Anthony Finkelstein

17

## Key Questions for Level 3

- Are the action items resulting from design reviews tracked to closure?
- Are the action items resulting from code reviews tracked to closure?
- Is a mechanism used for ensuring compliance with software engineering standards?
- Is a mechanism used for verifying that the samples examined by Software Quality Assurance are truly representative of the work performed?

© Wolfgang Emmerich & Anthony Finkelstein

18

LEVEL	CHARACTERISTIC	KEY PROBLEM AREAS	
optimising	improvement fed back into process	automation	↑
managed	quantitative measured process	changing technology problem analysis problem prevention	PRODUCTIVITY & QUALITY ↓ RISK
defined	process defined & institutionalised	process measurement process analysis quantitative quality plans	
repeatable	process dependent on individuals	training technical practices process focus	
initial	ad hoc/chaotic	project management project planning configuration management software quality assurance	

© Wolfgang Emmerich & Anthony Finkelstein 19

## Key Points

- In order to improve the software process in an organisation you must first understand it. Your improvements must be appropriate to the maturity level you discover. You cannot have a technical fix to fundamental management problems. You cannot skip a stage, any attempt to move directly from 1 to 5 is doomed to failure.
